Summary	Lead engineer on Capital One's Loyalty platform, owning the event-driven systems that process 60M+ rewards events and 30M+ partner API requests a day. Six years on the same platform, from building it to leading the team that modernizes it.	
Experience	Capital One / Lead Software Engineer Loyalty Earn Platform - Lead a team of five engineers building the next-generation Loyalty Earn Platform, one of six teams in a 30-40 engineer modernization effort. - Architected the event-driven processing pipeline handling 60M+ events a day, cutting rewards latency by 8 hours and processing runtime by 3 hours. - Designed the multi-region processing model — layered idempotency, event ordering, and consistency guarantees — that keeps reward processing correct across distributed streams. - Redesigned reward evaluation to support ordered benefits and threshold-based state transitions, unblocking the Discover integration where benefits could no longer be treated as independent. Partner Integrations - Consolidated 10 partner API endpoints into a single integration platform serving 30M+ requests a day for Amazon, PayPal, REI, and T-Mobile, with reusable abstractions that make onboarding a new partner a configuration change rather than a build. - Converged per-partner implementations into one shared codebase with automated regression coverage, so teams ship independently without breaking partner-specific behavior. - Modernized AutoRedemption on reusable event-driven patterns that became the foundation for Discover AutoRedemption. - Generalized the bureau data pipelines (Equifax, Experian, TransUnion) into a reusable onboarding path, migrated with 100% validation. Technical Leadership - Serve as the Loyalty platform SME across teams, owning event schemas and integration contracts with peer tech leads and Distinguished Engineers. - Break large architectural initiatives into multi-team implementation roadmaps with engineering managers and product owners.	Aug 2020 - Present, Remote
	University of Michigan EECS / Instructional Aide Taught lab sections and office hours for a web systems course — REST APIs, client- and server-side rendering, DNS, cloud deployment — and co-designed and graded exams and assignments.	Jan 2019 - Apr 2020
Projects	Novel Tracker — Cross-Platform Browser Extension - Shipped a local-first reading tracker to the Chrome Web Store, Firefox Add-ons, and the Mac App Store, with one shared core across Chrome, Edge, Firefox, and a native Safari extension. - Built cross-device sync on a Node.js API using Hybrid Logical Clocks and remove-wins merges, so offline edits resolve deterministically without a central lock. - Wrote 9 site-specific parsers with a generic fallback, and automated release packaging and Playwright end-to-end tests in GitHub Actions.	Personal project
Skills	Languages: Go, Python, Java Backend: Spring, event-driven and streaming systems, REST APIs, Docker Data: PostgreSQL, DynamoDB, Cassandra, MongoDB, DocumentDB AWS: Lambda, Fargate, EC2, Kinesis, SQS, SNS, EMR	
Education	University of Michigan / B.S. Computer Science Built a Paxos-based replicated key-value store in Go and a multi-threaded library for Unix in C++.	Aug 2016 - May 2020, Ann Arbor, MI
Certifications	AWS Solutions Architect	May 2021 - Present
